

VPN (Virtual Private Network) – Access from outside/home into University Network

This is a short description, on how to install and configure the vpn client, so that you can have full access to all the University services (e-mail, journals, servers, etc) from home or outside the University. If you are interested, I can give you a detailed explanation on how it works. Also on the web <http://www.id.unizh.ch/> you can find further information about this (in german).

In the meantime, I just give you this short introduction:

1. Download VPN client for OSX or Windows [download](#)
2. Install VPN client (choose simple installation)
3. Start VPN client
4. Remove sample configuration
5. [Download](#) and import UNIZH profile (Home_User_UNI_ZH_VPN_Connection.pcf) through the import menu
6. Restart computer

After restarting the computer, you can start again the VPN client and connect with the UniZH network. When you are asked for Login/Password, you must use **UniAccess** Username and Password (not ziaix-username/e-mail).

When connected, you should see in the lower right corner an IP address like this: 130.60.xxx.xx.

Now you have access to the whole university services (as you would be at the institute)
